

# Chapter 4

## Job Numbers & Body Panels

What is the meaning of those hand-written grease pencil numbers on the underbody of my Corvette? For years, factory hand-written marks have been the study, discussion and publication among Corvette enthusiasts. A frequent topic in Corvette forums, restorers are always encouraged to clean the chassis lightly, document with photography, and spare if at all possible.

Body panel marks, or job numbers for C2s,<sup>1</sup> and likewise early C3s, have been interpreted and described by John Hinckley.<sup>2</sup> The practice by factory workers of using grease pencils to mark fiberglass was to coordinate the assembly of body panels, prior to trim tag and vehicle identification number (VIN) assignment and plate attachment. At the point that body assembly began, the VIN plate and the trim tag had yet to be attached. In fact their purpose was not to inform workers of vehicle identification or paint and trim but rather document buyer options and comply with federal requirements. Therefore, workers depended on other manual methods to track assembly of body panels that were being prepared for buyer ordered options that would come later in assembly.

Chapter 4 of the *Corvette Buildsheet Book* describes how this manual method was used for the late-model C3 years. It discusses how this method adapted to the integration of data processing and the GMAD landscape style buildsheet. In this Chapter, data is used from 1973 (Figure 4a) through 1982 to show the quality of original factory marks and how they reconcile with available build records of this period.

1 Terms used are consistent with the works of Al Grenning and John Hinckley, published in the *The Corvette Restorer* that described C2 scheduling and assembly processes and production documents.

2 Hinckley, J., Numbers and the “Missing Link” the Broadcast Copy, *The Corvette Restorer*, Spring, 2003

### **The Job Number: Run Sheet**

So, how did the St. Louis Corvette assembly plant schedule, track and build each day's 100 plus Corvettes sequenced on the production schedule for a given day? The run sheet, a rarely seen but decades-old production method! As dealer orders were processed by the St. Louis assembly plant, Scheduling and Production Control Departments would prepare the daily production schedules based on material and supply availability, options and balancing assembly line workloads. Each day, the schedules were distributed to the body shop showing the orders, their options and assigned a schedule sequence number. These schedules were called run sheets. Other schedules were also used that were a derivative of the run sheet called a low-run sheet, none of which survived the St. Louis plant era. Believe it or not, quite similar methods are still used today in the Bowling Green Corvette assembly plant. Figure 4b is an example of a 2008 low-run sheet, displayed in an Excel spreadsheet format for the chassis and shows model, paint, order-related RPOs and of course, the pre-assigned VIN.

### The Job Number: Body Panel

The manifest used box 10 with the caption SCHED NO DATE to print schedule related information and an expected date of production. The use of box 10 to display this data was consistent throughout the 1973-82 period.

Figure 4e shows schedule code 10-0195 for a 1973 Corvette with job number 195 (See Figure 4a). The schedule shows the expected date of production 06-22. The trim tag date code is K21, a day earlier than the estimated date. In 1973, trim tag attachment was installed at the end of the Body Shop as the vehicle was readied for the Trim Line.

Figure 4e: Build Sheet 1973

This technical article is adapted from Chapter 4 of the *Corvette Buildsheet Book: A Study Guide from 1973-82 Build Records* by Tom Russo. The Study Guide chronicles the study and use of 1973-82 Corvette buildsheets.
